SEEPAGE LINE AND HYDRODYNAMIC NET IN EMBANKMENT DAMS

to determine the position of the top seepage line after the establishment of the stationary flow, which represents an upper boundary line of motion, there are a number of methods

3) Hydrodynamic net through a homogeneous dam and through the core of an earth-rock dam.

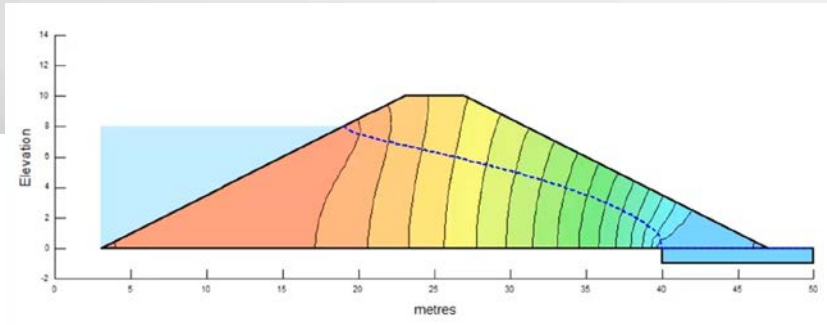

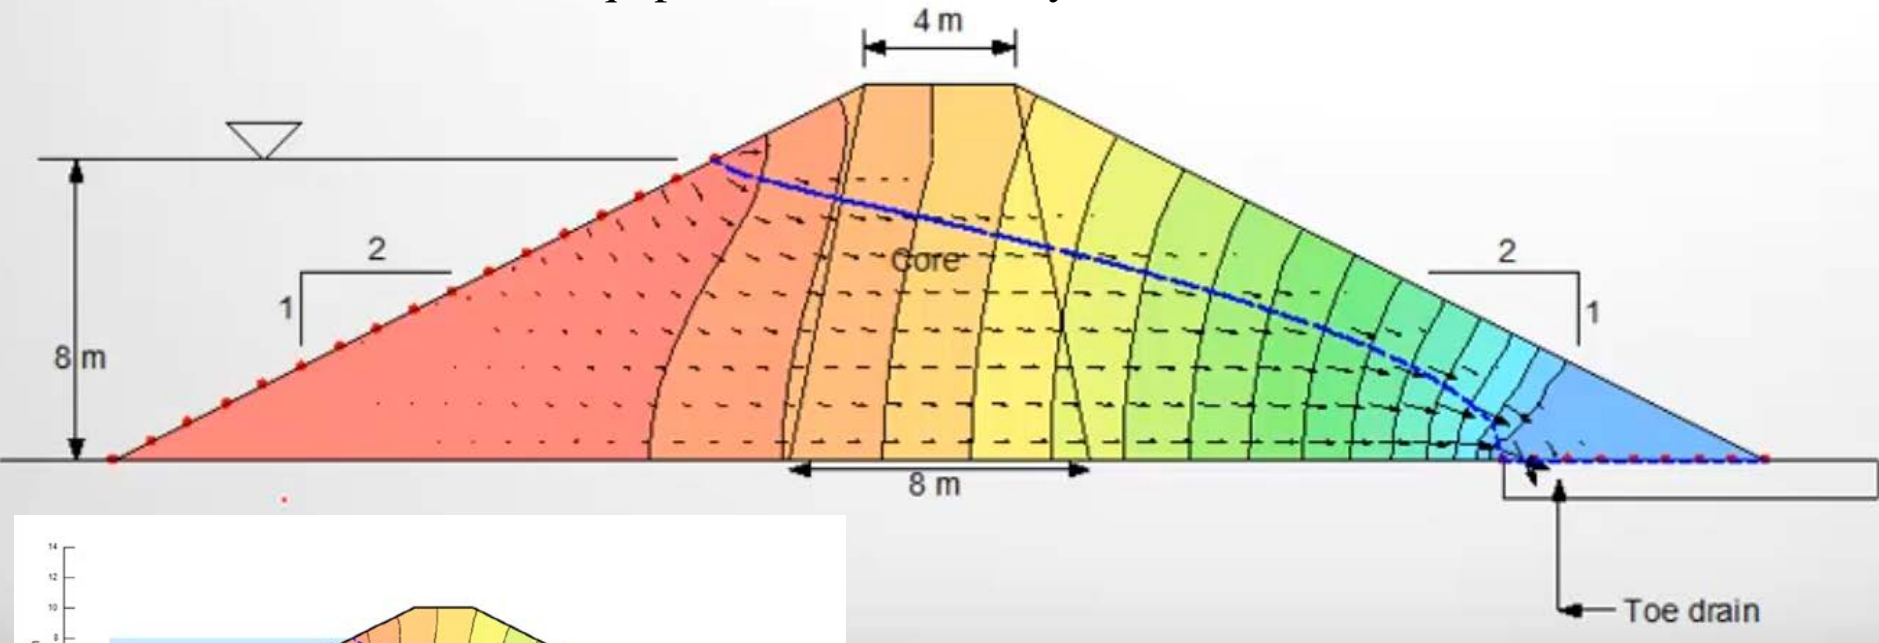

in the example of a homogeneous earthfill dam Casagrande approximates the seepage line with a parabola

Equipotential lines (in metres) for a homogeneous dam on an impervious foundation for a stationary seepage flow, obtained by means of the finite element method using SEEP/W. (1) Dam's body of poorly permeable earth material; (2) drainage prism; (3) seepage line.

Equipotential lines, steady state case NWL

1 day

Equipotential lines,
rapid drawdown

12 day

Control of seepage

Seepage within and under the embankment must be controlled to prevent internal erosion and migration of fine materials (from the core), or external erosion

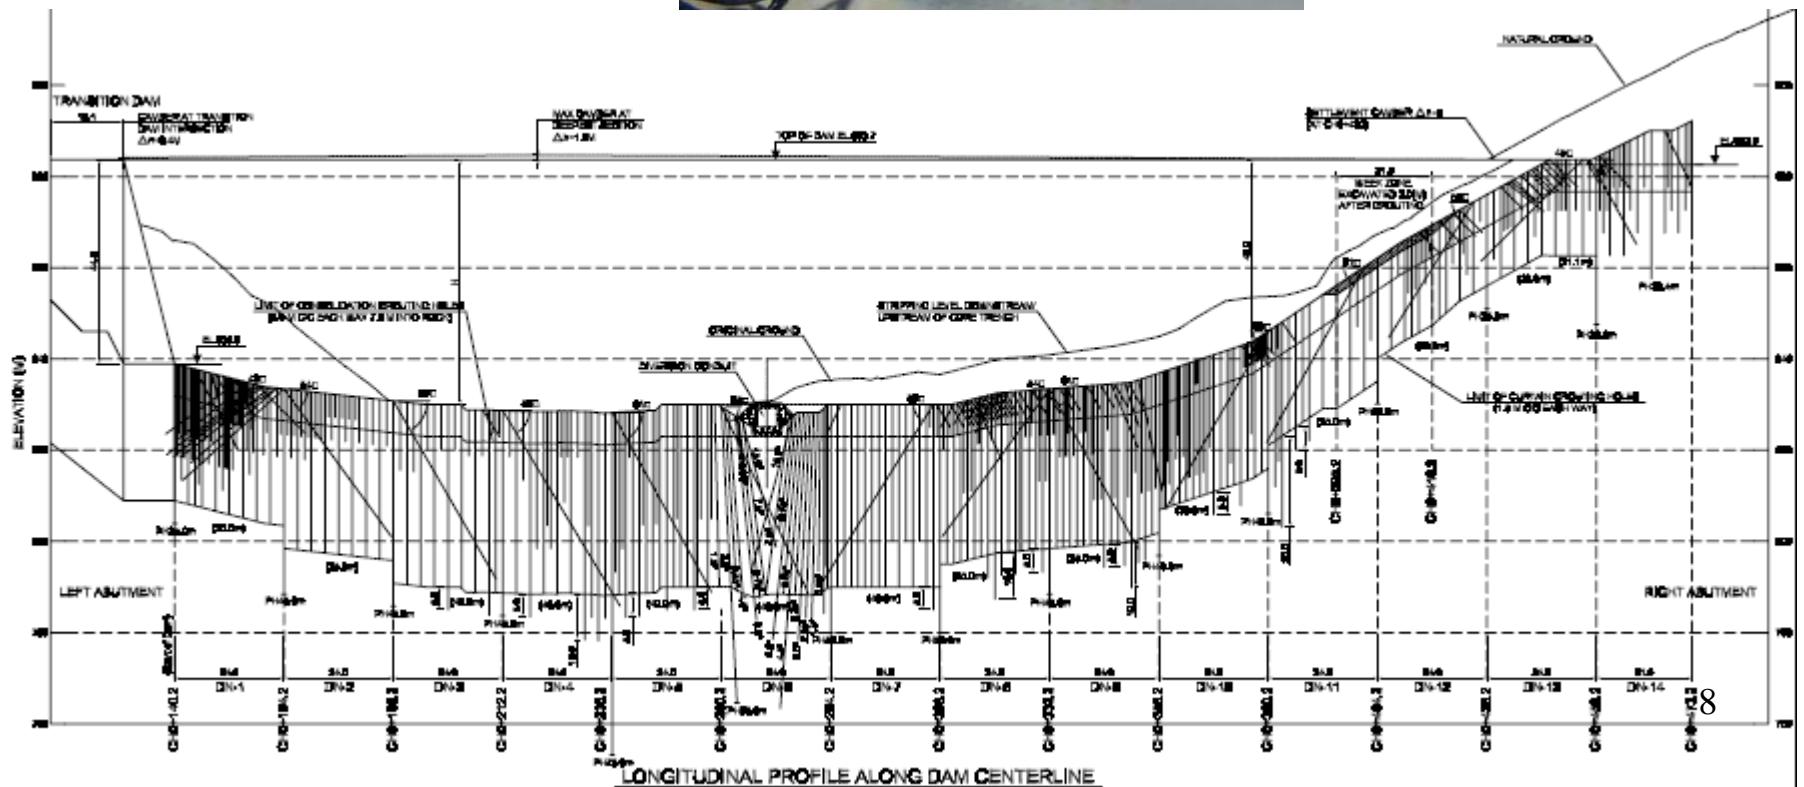

Seepage

Seepage control in dam body and foundation

GROUT CURTAIN

Foundation seepage control

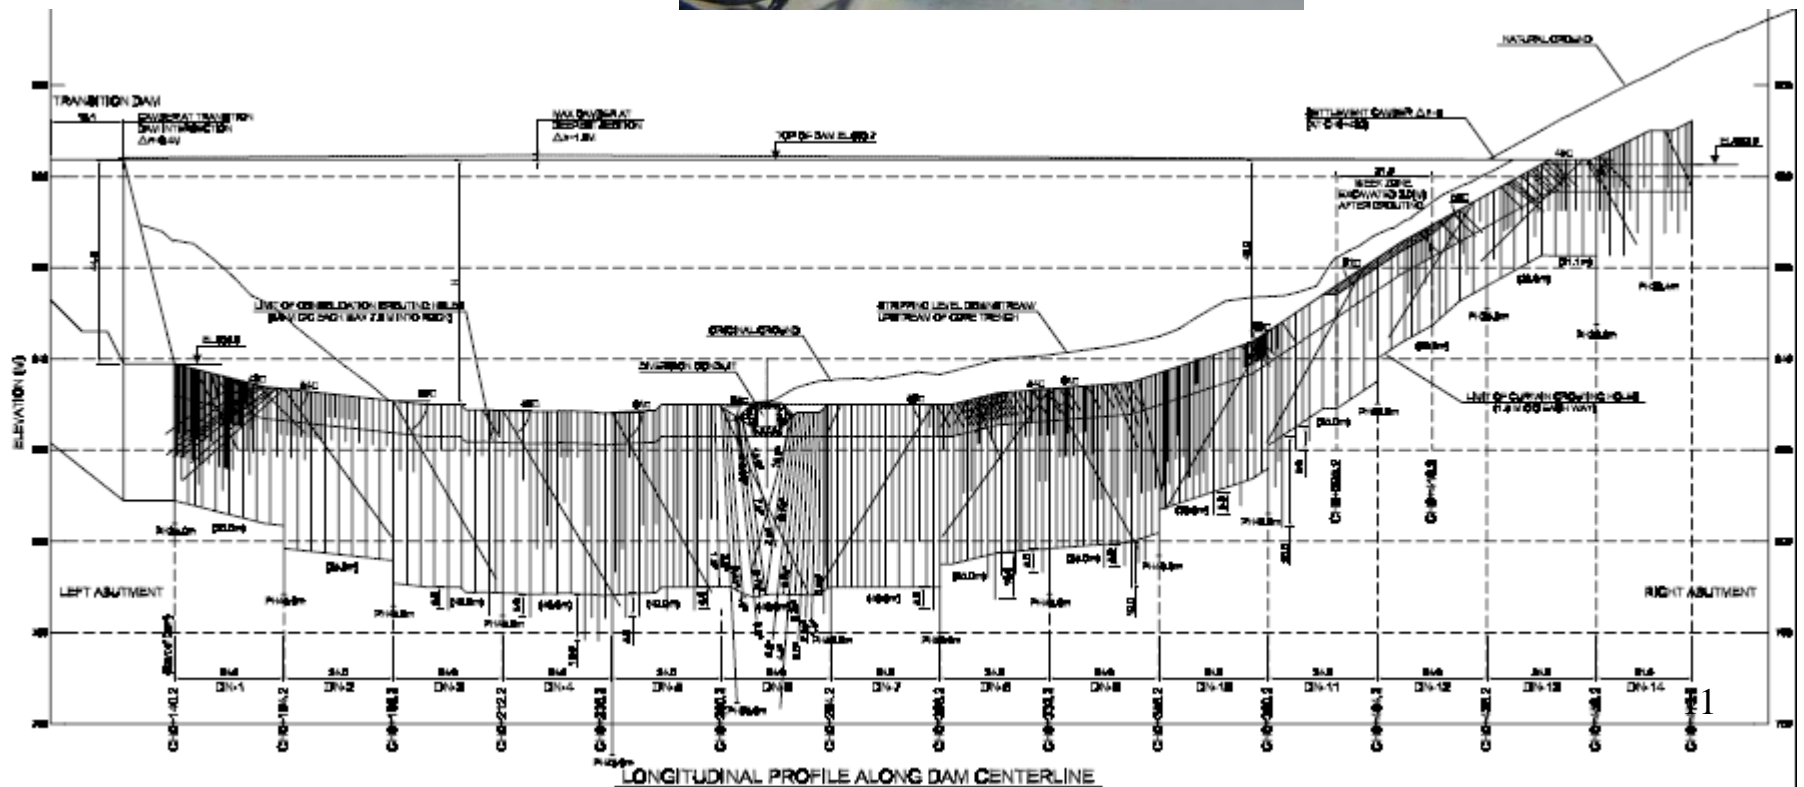

(a) Open trench cut-off (to moderate depth only)

Foundation seepage control

(b) Grouted cut-off
(need not penetrate to impervious horizons)

GRAUTED CUT-OFF

ARRANGEMENT OF GROUTING HOLE - PLAN
SCALE - A

FRONS OF CONSOLIDATION HOLES
[RIGHT BANK FROM C-G-100.5 TO C-G-100.7]
[LEFT BANK FROM STUDY LINE AT 4.50 TO 4.75 UPSTREAM]

drilling →

P, Mpa → z of the plate

$$z = \frac{10^3 p}{n\gamma_b} m, p[MPa]$$

waterstops

Foundation seepage control

(c) Diaphragm cut-off (need not penetrate to impervious horizons)
