Co-funded by the Erasmus+ Programme of the European Union

Predicting formation of disinfection by-products under Climate Change uncertainties

Zakhar Maletskyi, Harsha Ratnaweera

Norwegian University of Life Sciences

Water Harmony

International Symposium "Water Resources Management: New Perspectives and Innovative Practices„
Novi Sad, 23-24 September 2021

Water Harmony research group

swarm

Environmental & Industrial Process Analytics

Smart Water Quality Monitoring
- Soft sensors for nutrients and contaminants of emerging concern
- Sensor fusion

Process Surveillance and Control
- Data Mining and Big Data Analytics
- Machine learning and ANN
- Digital water security
- Real-time Predictive Analytics
- Image analysis in process surveillance

Advanced Water & Wastewater Treatment

Coagulation & Flocculation
- State-of-the-art coagulation control
- Fusion of coagulants
- Nature-derived reagents
- Increasing fertiliser value of coagulated sludge

Membrane Separation
- Ceramic Membrane Biological Reactor
- Nanofiltration for surface water treatment
- Reverse Osmosis for groundwater treatment

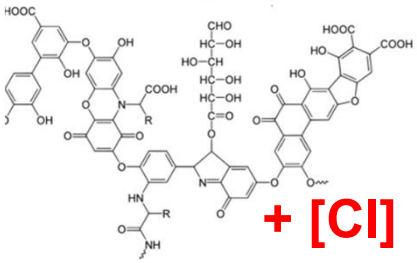
Electrochemical Methods
- Electrocoagulation
- Electrooxidation of Contaminants of Emerging Concern

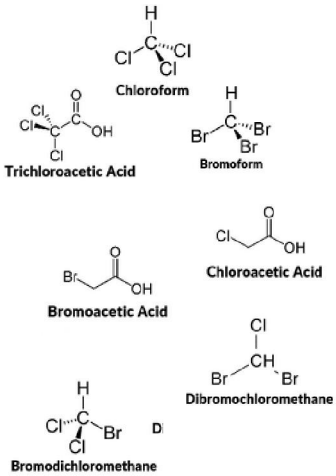
Why?

Climate Change → Natural Organic Matter (NOM) → Oxidative disinfection → Disinfection by-products (DBPs)

Disinfection by-products (DBPs)

swarm





Lee, Kim, et al., 2013

Luben, Olshan, et al., 2013

Kogevinas, Villanueva, et al., 2010

4

NOM concentration is increasing

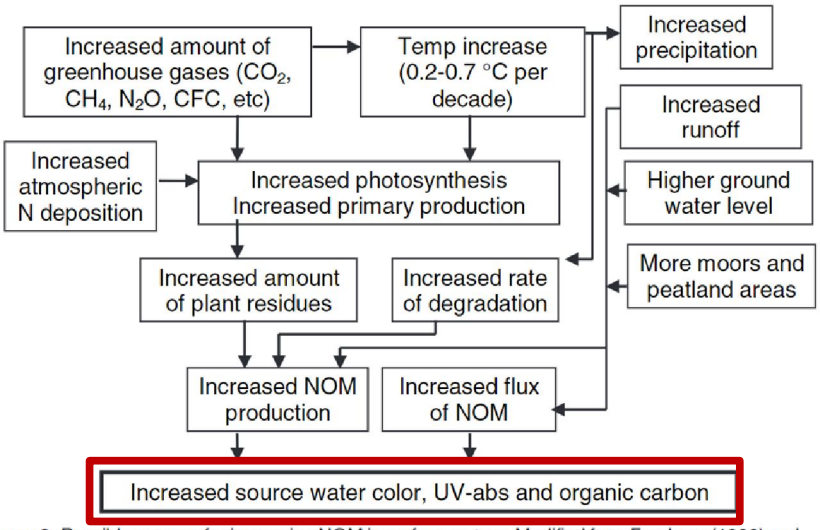


Figure 2 Possible reasons for increasing NOM in surface waters. Modified from Forsberg (1992) and Liltved (2002)

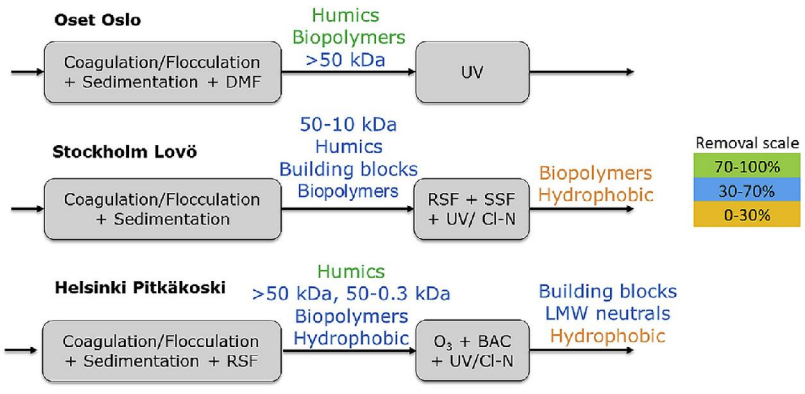
5

Climate Change and NOM in surface water



Remaining NOM: high MW fraction >50kDa (55-80%), consisting of humics (33-62%), building blocks (14-30%) and LMW neutrals (7-17%)

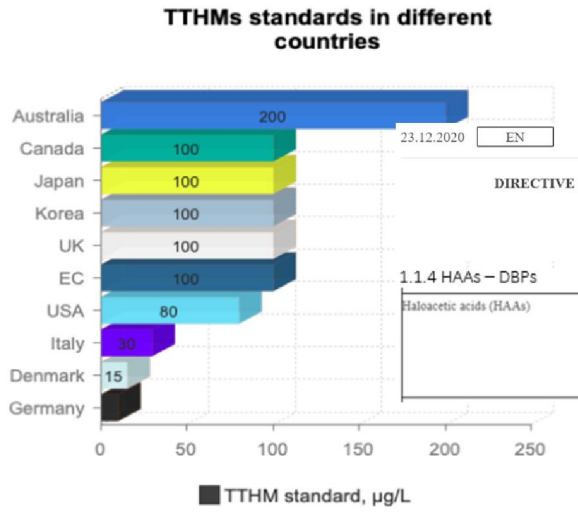
Legal requirements



23.12.2020 EN Official Journal of the European Union L 435/1

DIRECTIVE (EU) 2020/2184 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 16 December 2020

on the quality of water intended for human consumption

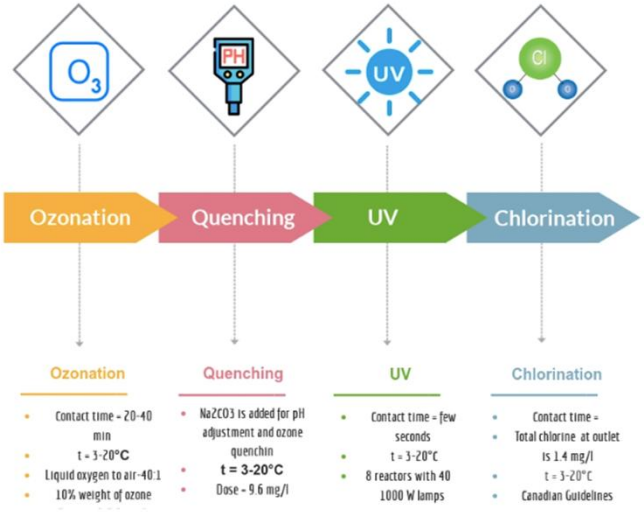
1.1.4 HAAs – DBPs

Haloacetic acids (HAAs)	60	µg/l	This parameter shall be measured only when disinfection methods that can generate HAAs are used for the disinfection of water intended for human consumption. It is the sum of the following five representative substances: monochloro-, dichloro-, and trichloro-acetic acid, and mono- and dibromo-acetic acid.

Bond, Goslan, et al., 2012

7

Study case



Can we predict DBPs based on raw water and process parameters?

1,5 3	15 45	2

Results:
- THM
- UV254
- *UV-VIS spectra*

Research questions:

1.1 Which minimal analysis data can be used to identify the source of water for unknown samples accurately?

1.2 Can difficult-to-measure ***off-line*** parameters (TOD, TOC, SUVA) be estimated through easy-to-measure ***at-line*** parameters (Color, UV254) and ***in-line*** parameters (pH, Turb, UV-VIS spectrum)

2.1 Which minimal analysis data can be used to predict results of THMFP tests:
- ***in-line*** parameters (pH, Turb, UV-VIS spectrum)
- ***at-line*** parameters (Color, UV254)
- ***off-line*** parameters (TOD, TOC, SUVA)

3.1 Is there a model to maintain THM ≤ 50 by varying O_3 and Time for water with specific parameters?

3.2 Are there characteristic changes in UV-VIS spectra of raw and treated water that can be used to predict THM in treated water?

Analysed parameters

Correlation coefficients									
Parameters	**THM**	**SUVA**	**Color**	**TU**	**COND.**	**pH**	**TOD**	**TOC**	**UV $_{254}$**
THM	1

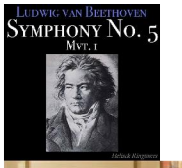
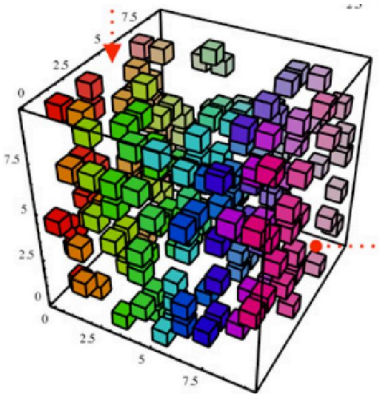
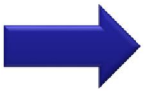
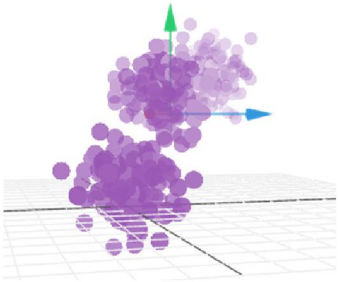
How to extract important information?



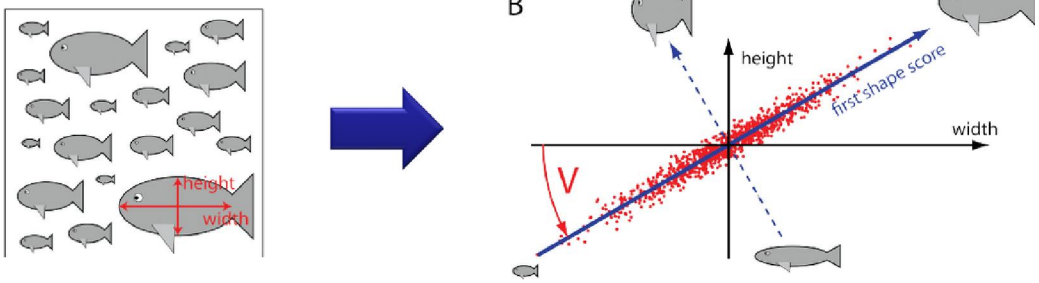
How to extract important information?



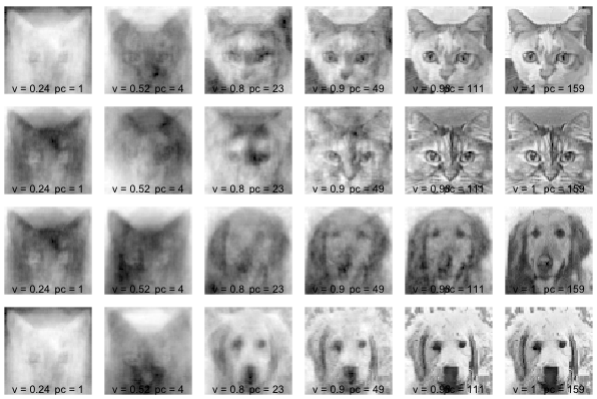




How to extract important information?



How to extract important information?

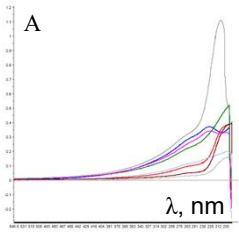


How to extract important information?

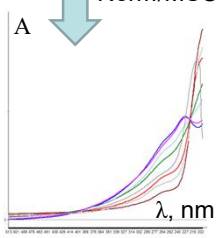
Dimensionality reduction

- Feature Elimination
- **Feature Extraction**
  - We transform the original set of features into another set of features
  - The idea is to pack the most important information into as few derived features as possible
  - **Derived features are a linear combination of the original features**

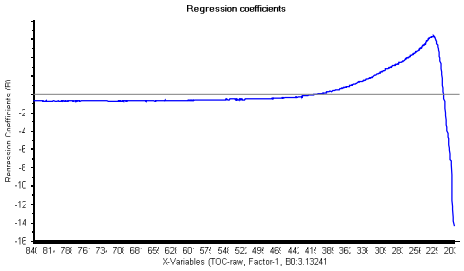
From UV-VIS to TOC

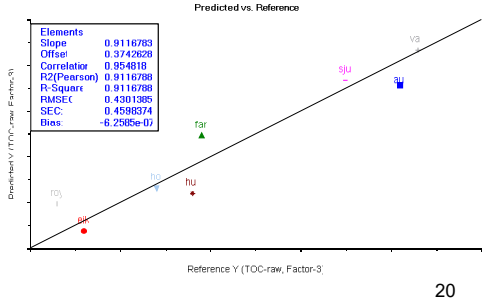


Norm/MSC/SmoothingSG



PLSR

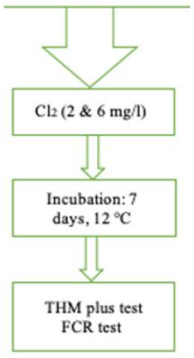




20

THM Formation Potential (HACH)

- Worst case scenario – 7 days incubation time
- Function of chlorine dose, TOC, temperature, reaction time, and pH
- Can be used for both design & operation of water treatment system
- Helps to get an idea of the THM max possible concentration



21

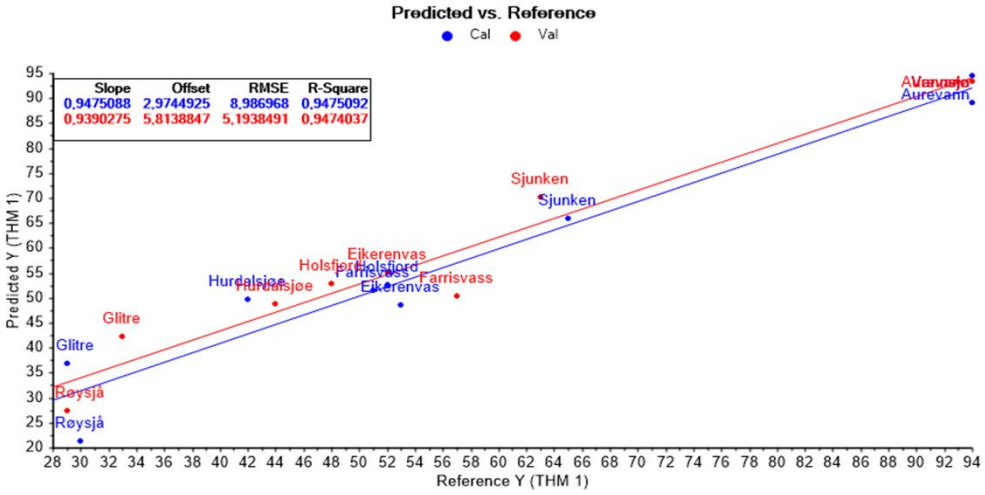
THM Formation Potential (HACH)

	Vannsjø	Aurevann	Sjunken	Farrisvann	Hurdalsjøen	Holsfjord	Glitre	Eikerenvann	Røysjå
2 mg/l Chlorine (t=0min)	54.00	94.00	64.00	54.00	29.50	50.00	31.00	52.50	29.50
2 mg/l Chlorine	188.50	292.50	66.00	64.50	32.00	91.50	31.50	146.50	32.00
6 mg/l Chlorine	195.50	354.00	76.50	82.00	45.00	112.50	46.50	174.00	45.00

* - This table includes average data from duplicate experiments

22

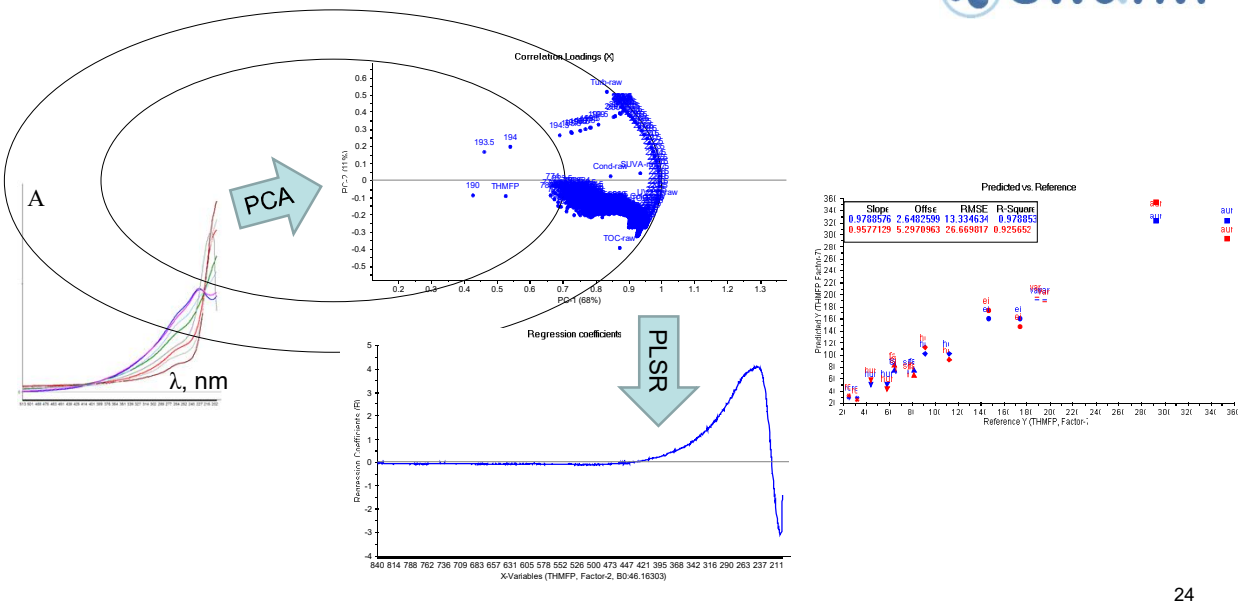
1. Multiple Linear Regression (MLR) for simple water quality parameters



THMFP = -142.66 + 626.24**[UV254]** + 21.90**[pH]** + 4.97**[Turbidity]** - 0.05**[Conductivity]** - 2.02**[Colour]**

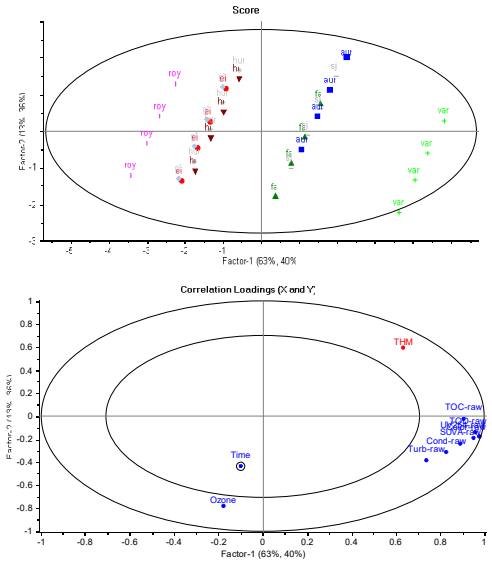
23

THM Formation Potential



24

THM concentration in effluent



25

Conclusions

- **<u>Climate Change</u>** will continue influencing NOM content in surface water, incl. cold climate zones
- This will **<u>increase risks of exposure to DBPs</u>**, incl. THMs
- **<u>Rapid and online methods of DBPs surveillance</u>** are desired in order to establish analysis routines and improve process control
- **<u>UV-VIS online spectroscopy</u>** together with simply measured parameters can help to estimate THMFP and THM concentration in effluent
- **<u>Alarms over control limits</u>** may trigger lab analysis or control measures
